# Package 'XINA'

August 20, 2018

**Type** Package

**Title** Multiplexes isobaric mass tagged-based kinetics data for network analysis

**Version** 0.99.0

**Date** 2018-08-13

**Author** Lee, Lang Ho and Singh, Sasha A.

**Maintainer**
Lang Ho Lee <langholee@gmail.com> and Sasha A. Singh <sasingh@bwh.harvard.edu>

**Description** An intuitive R package simplifies network analyses output from multiplexed high-dimensional proteomics/trascriptomics kinetics data.

**Encoding** UTF-8

**LazyData** true

**License** GPL-3

**Depends** R (>= 3.5), Biobase

**Imports** mclust, plyr, alluvial, ggplot2, igraph, gridExtra, tools, grDevices, graphics, utils, STRINGdb

**biocViews** SystemsBiology, Proteomics, RNASeq, Network

**RoxygenNote** 6.0.1

**VignetteBuilder** knitr

**Suggests** knitr, rmarkdown

## R topics documented:

---

`add_legend` *add_legend*

---

## Description

Add plot legend and locate it outside of a network plot

## Usage

```
add_legend(legend_location = "bottomright", ...)
```

## Arguments

| | |
|---|---|
| `legend_location` | Network centrality score matrix |
| `...` | Numeric, complex, or logical vectors. |

## Value

a legend to a plot

---

`alluvial_enriched` *alluvial_enriched*

---

## Description

'alluvial_enriched' draws an alluvial plot and finds comigrated proteins. The comigration is a group of proteins that show the same expression pattern, classified and evaluated by XINA clustering, in at least two conditions. XINA can reduce the dataset complexity by filtering based on the number of comigrated proteins (size, 'comigration_size' parameter) and perform an enrichment test (P-value of Fisher's exact test, 'pval_threshold') to determine significance of enriched comigrations. The Fisher's exact test can only be done for two conditions at a time. The following 2x2 table was used to calculate the P-value from the Fisher's exact test. To evaluate significance of co-migrated proteins from cluster #1 in control to cluster #2 in test group,

| - | cluster #1 in control | other clusters in control |
|---|---|---|
| cluster #2 in test | 65 (TP) | 175 (FP) |
| other clusters in test | 35 (FN) | 979 (TN) |

## Usage

```
alluvial_enriched(clustering_result, selected_conditions,
  comigration_size = 0, pval_threshold = 1, pval_method = "fdr",
  cex = 0.7, alpha = 0.3)
```

## Arguments

| | |
|---|---|
| `clustering_result` | A list containing XINA clustering results. See xina_clustering |
| `selected_conditions` | A vector of condition names used in XINA clustering results. The number of selected conditions should be at least two. |
| `comigration_size` | The number of proteins comigrated together in the selected conditions of XINA clustering results. Default is 0 |
| `pval_threshold` | This option is avaiable only when you selected two conditions for comigration search. |
| `pval_method` | Method for p-value adjustment. See p.adjust |
| `cex` | Scaling of fonts of category labels. Default if 0.7. See alluvial |
| `alpha` | Transparency of the stripes. Default if 0.3. See alluvial |

## Value

A data frame containing comigrations and an alluvial plot showing comigrations

## Examples

```
# load XINA example data
data(xina_example)

# Get the experimental conditions in the example data
classes <- as.vector(example_clusters$condition)

# Get comigrations without any thresholds
all_comigrations <- alluvial_enriched(example_clusters, classes)

# Get comigrations that have >= 5 size (the number of comigrated proteins)
all_cor_enriched <- alluvial_enriched(example_clusters, classes, comigration_size=5)

# Get all the comigrations between Control and Stimulus1
comigrations_Control_Stimulus1 <- alluvial_enriched(example_clusters,
c(classes[1],classes[2]))

# Get comigrations between Control and Stimulus1, that have >=5 size
comigrations_Control_Stimulus1_over5 <- alluvial_enriched(example_clusters,
c(classes[1],classes[2]), comigration_size=5)

# Get comigrations between Control and Stimulus1,
# that have >= 5 size and enrichment FDR <= 0.01
comigrations_Control_Stimulus1_pval0.01_size5 <- alluvial_enriched(example_clusters,
c(classes[1],classes[2]), comigration_size=5, pval_threshold=0.01)

# Get  comigrations between Control and Stimulus1,
# that have >= 5 size and enrichment Benjamini & Yekutieli <= 0.01
comigrations_Control_Stimulus1_BY0.01_size5 <- alluvial_enriched(example_clusters,
c(classes[1],classes[2]), comigration_size=5, pval_threshold=0.01, pval_method="BY")
```

---

`alluvial_enrichment_tests` *alluvial_enrichment_tests*

---

## Description

Fisher's exact test to calculate the significance over all comigrations. The following 2x2 table was used to calculate p-value from Fisher's exact test. To evaluate significance of comigrated proteins from cluster #1 in control to cluster #2 in test condition,

| | **cluster #1 in control** | **other clusters in control** |
|---|---|---|
| **cluster #2 in test** | 65 (TP) | 175 (FP) |
| **other clusters in test** | 35 (FN) | 979 (TN) |

'alluvial_enrichment_tests' also provides another statistical methods including Hypergeometric test and Chi-square test.

### Usage

```
alluvial_enrichment_tests(count_table, c1, c2, non_cluster = 0,
  test_type = "fisher")
```

### Arguments

| | |
|---|---|
| count_table | A data frame generated by using count. |
| c1 | A selected cluster in the first condition. |
| c2 | A selected cluster in the second condition. |
| non_cluster | The cluster number for proteins that were not detected in a specific sample. Default is 0. |
| test_type | Enrichment test type. 'fisher' = Fisher's exact test, 'hyper' = Hypergeometric test, 'chisq' = Chi-square test |

### Value

P-value of comigration enrichment test and 2x2 table information

---

## calculate_centrality_scores

*calculate_centrality_scores*

---

### Description

'calculate_centrality_scores' computes network centrality scores

### Usage

```
calculate_centrality_scores(net, centrality_type = "Degree")
```

### Arguments

| | |
|---|---|
| net | protein-protein interaction network of igraph |
| centrality_type | the maximum number of clusters |

### Value

A vector of network centrality scores

## default_size *default_size*

### Description

Calculate image size based on the number of clusters

### Usage

```
default_size(max_cluster)
```

### Arguments

| | |
|---|---|
| max_cluster | the maximum number of clusters |

### Value

A vector of plot width and height

## draw_alluvial_plot *draw_alluvial_plot*

### Description

'draw_alluvial_plot' draw a alluvial plot

### Usage

```
draw_alluvial_plot(clustering_result, selected_conditions, count_table,
  alluvia_colors = NULL, cex = 0.7, alpha = 0.3)
```

### Arguments

| | |
|---|---|
| clustering_result | A list containing XINA clustering results. See xina_clustering. |
| selected_conditions | A vector of condition names used in XINA clustering results. The number of selected conditions should be at least two. |
| count_table | A data frame generated by using count. |
| alluvia_colors | A vector containing the user-defined colors for each alluvium. |
| cex | Size of cluster number on block axis. Default if 0.7. See alluvial. |
| alpha | Transparency of alluvia colors. Default is 0.3. See alluvial. |

### Value

An alluvial plot displaying comigrations and the data frame containing the input count_table with colors.

## Examples

```
# load XINA example data
data(xina_example)

# get a vector of experimental conditions analyzed in the clustering results
classes <- as.vector(example_clusters$condition)

comigrations_size_over5 <- alluvial_enriched(example_clusters, classes, comigration_size=5)
draw_alluvial_plot(example_clusters, classes, comigrations_size_over5)
```

---

`example_clusters` *Randomly generated example datasets for XINA users. A dataset containing the XINA clustering results. example_clusters*

---

## Description

- aligned. XINA clustering results aligned by conditions
- data_column. Column names for data matrix
- out_dir. Not available in this example dataset
- nClusters. The number of user-desired clusters. It's 30 in the example.
- max_cluster. The number of clusters found in the dataset. It's 21 in the example.
- chosen_model. The chosen covariance model for the example dataset. It's VEI in the example
- optimal_BIC. BIC at the optimized clustering. It's 29473.57 in the example
- condition. The experimental conditions in the dataset.
- color_for_condition. The default color for the conditions that will be used in XINA plot drawing.
- color_for_clusters. The default color for the clusters that will be used in XINA clustering plot.
- norm_method. The used normalization method to standardize the input data. It's "sum_normalization" in the example.

## Format

A list with the example XINA clustering result

---

`extract_data_column` *extract_data_column*

---

## Description

Extract data column names from XINA clustering result

## Usage

```
extract_data_column(col_head_of_clustering)
```

### Arguments

`col_head_of_clustering`
: Column names of XINA clustering result

### Value

A vector containing column names of data matrix

---

## `find_similar_clusters` *find_similar_clusters*

---

### Description

Compare clusters and find similar ones

### Usage

```
find_similar_clusters(clustering_result, threshold = 0.95)
```

### Arguments

`clustering_result`
: A list containing XINA clustering results. See xina_clustering

`threshold`
: Pearson's r threshold to find similar ones

### Value

Write a csv file containing similar clustering information based on the given Pearson's R threshold

---

## `generate_count_table` *generate_count_table*

---

### Description

Count the number of comigrated proteins using count

### Usage

```
generate_count_table(clustering_result, selected_conditions, comigration_size)
```

### Arguments

`clustering_result`
: A list containing XINA clustering results. See xina_clustering

`selected_conditions`
: A vector of condition names used in XINA clustering results.

`comigration_size`
: The number of proteins comigrated together in the selected conditions of XINA clustering results. Default is 0.

### Value

A data frame containing comigrations.

---

`generate_superset` *generate_superset*

---

### Description

Merge input kinetics files

### Usage

```
generate_superset(f_names, data_column, delim = ",",
  norm = "sum_normalization")
```

### Arguments

| | |
|---|---|
| `f_names` | A vector of .csv file paths containing kinetics data |
| `data_column` | A vector of column names containing data matrix |
| `delim` | The delimiter of input file (default is ',') |
| `norm` | The normalization method. It should be one of c('sum_normalization', 'zs-core'). Default is 'sum_normalization'. |

### Value

A data frame containing kinetics data obtained from files in the f_names vector

---

`get_colors` *get_colors*

---

### Description

Generate color series for XINA graphics

### Usage

```
get_colors(nClusters, set = "", colorset = NULL)
```

### Arguments

| | |
|---|---|
| `nClusters` | The number of clusters |
| `set` | Pre-defined color series set |
| `colorset` | manually defined color codes |

### Value

A vector for color code of XINA graphics

get_color_for_nodes *get_color_for_nodes*

## Description

Pre-defined 30 colors

## Usage

```
get_color_for_nodes()
```

## Value

A vector for color code of XINA graphics

get_comigrations_by_name *get_comigrations_by_name*

## Description

'get_comigrations_by_name' finds proteins comigrated with the given proteins

## Usage

```
get_comigrations_by_name(clustering_result, selected_conditions, protein_list,
  cex = 0.7, alpha = 0.3)
```

## Arguments

| | |
|---|---|
| clustering_result | A list containing XINA clustering results. See xina_clustering |
| selected_conditions | A vector of condition names used in XINA clustering results. The number of selected conditions should be at least two. |
| protein_list | A vector containing gene names. |
| cex | Size of cluster number on block axis. Default if 0.7. See alluvial |
| alpha | Transparency of alluvia colors. Default is 0.3. See alluvial |

## Value

An alluvial plot displaying comigrations and the data frame containing comigrations of the input proteins

## Examples

```
# load XINA example data
data(xina_example)

# the clustering result table
all_proteins  <- as.character(example_clusters$aligned$`Gene name`)
# get a vector of experimental conditions analyzed in the clustering results
classes <- as.vector(example_clusters$condition)

comigrated_prots_all <- get_comigrations_by_name(example_clusters, classes, all_proteins[1:3])
```

---

`get_condition_biased_comigrations` *get_condition_biased_comigrations*

---

## Description

get comigrations that at least one biased cluster is involved in. Biased clusters are defined by

## Usage

```
get_condition_biased_comigrations(clustering_result, count_table = NULL,
  selected_conditions, condition_composition, threshold_percent = 50,
  color_for_null = "gray", color_for_highly_matched = "red4", cex = 0.7,
  alpha = 0.3)
```

## Arguments

| | |
|---|---|
| `clustering_result` | A list containing XINA clustering results. See xina_clustering |
| `count_table` | A data frame generated by using count. If count_table is NULL (by default), XINA will consider all the comigrations. |
| `selected_conditions` | A vector of condition names used in XINA clustering results. The number of selected conditions should be at least two. |
| `condition_composition` | The resulting data frame of 'plot_condition_compositions'. See plot_condition_compositions. |
| `threshold_percent` | Default is 50. The percentage threshold for finding condition-biased clusters |
| `color_for_null` | A color for non-condition-biased comigrations. Default is 'gray' |
| `color_for_highly_matched` | A color for comigrations that are involved with more than two condition-biased clusters. Default is 'red4' |
| `cex` | Size of cluster number on block axis. Default if 0.7. See alluvial. |
| `alpha` | Transparency of alluvia colors. Default is 0.3. See alluvial. |

## Value

An alluvial plot displaying comigrations and the data frame containing condition-biased comigrations.

## Examples

```
# load XINA example data
data(xina_example)

# get a vector of experimental conditions analyzed in the clustering results
conditions <- as.vector(example_clusters$condition)

# get condition composition information
condition_composition <- plot_condition_compositions(example_clusters)

comigrations_size10 <- alluvial_enriched(example_clusters, conditions, comigration_size=10)
# Finding condition-biased comigrations by 50% threshold
condition_biased_comigrations <-
get_condition_biased_comigrations(clustering_result=example_clusters,
count_table=comigrations_size10, selected_conditions=conditions,
condition_composition=condition_composition)

# Finding condition-biased comigrations by 70% threshold
condition_biased_comigrations <-
get_condition_biased_comigrations(clustering_result=example_clusters,
count_table=comigrations_size10, selected_conditions=conditions,
condition_composition=condition_composition,
threshold_percent=70)
```

---

# get_layout *get_layout*

---

## Description

Get igraph layout by the number of nodes

## Usage

```
get_layout(subnet_condition)
```

## Arguments

| | |
|---|---|
| subnet_condition | A igraph sub-network |

## Value

igraph network layout

get_mTOR_proteins *get_mTOR_proteins*

## Description

Get mTOR pathway genes

## Usage

```
get_mTOR_proteins(time_points, conditions)
```

## Arguments

| | |
|---|---|
| time_points | A vector containing time points of the data matrix |
| conditions | A vector containing condition information, for example normal, disease and drug treated disase. |

## Value

A vector containing mTOR pathway gene names

---

get_random_data *get_random_data*

## Description

Get randomized time-series data

## Usage

```
get_random_data(time_points, conditions, num_total, percent.sign = 0.1,
  equal = TRUE)
```

## Arguments

| | |
|---|---|
| time_points | A vector containing time points of the data matrix |
| conditions | A vector containing condition information, for example normal, disease and drug treated disase. |
| num_total | The number of total proteins to be generated |
| percent.sign | Percentage of differentially expressed proteins. Ignored when equal=FALSE. |
| equal | If equal is TRUE, all the conditions will have numbers between 0 and 1. If it is FALSE, the first three conditions will have different ranges. First condition will have numbers from 0.3 to 0.4. Second condition will have numbers from 0.6 to 0.8. Third condition will have numbers from 0.3 to 0.5. Other conditions will have numbers from 0 to 1. |

## Value

A list containing ramdomly generated data matrix

## get_stats *get_stats*

### Description

Calculate statistics of the given data for XINA network analysis

### Usage

```
get_stats(centrality_results, na.rm = FALSE)
```

### Arguments

| | |
|---|---|
| centrality_results | Network centrality score data frame calculated by XINA network module |
| na.rm | If it is FALSE, no exclusion of NA values. |

### Value

A data frame containing statistics of XINA network centrality scores

## get_theme_blank *get_theme_blank*

### Description

Predefined ggplot theme for removing ticks, titles and labels of X and Y axis

### Usage

```
get_theme_blank()
```

### Value

A ggplot theme

get_unknown_ppi_nodes *get_unknown_ppi_nodes*

## Description

Get proteins with no known interactions within the cluster based on the used protein-protein interaction database source

## Usage

```
get_unknown_ppi_nodes(xina_result, cl)
```

## Arguments

| | |
|---|---|
| xina_result | A list containing XINA network analysis results. See xina_analysis |
| cl | the clustering number of XINA clustering results. See xina_clustering |

## Value

A data frame containing proteins with no known interactions within the cluster based on the used protein-protein interaction database source

## Examples

```
library(STRINGdb)

# load XINA example data
data(xina_example)

# Get STRING database for protein-protein intereaction information
string_db <- STRINGdb$new( version='10', species=9606, score_threshold=0, input_directory='' )
string_db

# XINA analysis with STRING DB
xina_result <- xina_analysis(example_clusters, string_db, flag_simplify=FALSE)

# Extract unknown PPI nodes in the cluster #1
get_unknown_ppi_nodes(xina_result, 1)
```

gn *A character vector containing 19,396 human genes This is for the randome data generation of XINA gn*

## Description

- Characters of human genes

## Format

A character vector containing 19,396 human genes

### Source

https://www.ncbi.nlm.nih.gov/gene

---

gn_desc — *A character vector containing 19,396 human gene descriptions This is for the randome data generation of XINA gn_desc*

---

### Description

- Human gene description corresponding to 'gn' vector

### Format

A character vector containing 19,396 human gene descriptions

### Source

https://www.ncbi.nlm.nih.gov/gene

---

hprd_ppi — *Protein-protein interaction resource downloaded from HPRD DB A data frame containing HRPD protein-protein interaction data hprd_ppi*

---

### Description

- gene_symbol_1. Gene name interacting with gene name in 'gene_symbol_2'
- gene_symbol_2. Gene name interacting with gene name in 'gene_symbol_1'
- Experiment_type. Experimental or computational methods supporting the interaction

### Format

A data frame containing HRPD protein-protein interaction data

### Source

http://www.hprd.org/

## length2 *length2*

### Description

Customized function for vector length calculation

### Usage

```
length2(x, na.rm = FALSE)
```

### Arguments

| | |
|---|---|
| x | A vector |
| na.rm | If it is FALSE, no exclusion of NA values. |

### Value

A vector length

## load_previous_results *load_previous_results*

### Description

Get previous XINA clustering results to R space

### Usage

```
load_previous_results(clustering_dir = getwd(), data_column = NULL,
  fp_clusters = "xina_clusters.csv")
```

### Arguments

| | |
|---|---|
| clustering_dir | The directory path of XINA clustering results |
| data_column | A vector containing column names of data matrix |
| fp_clusters | File path of XINA clustering results |

### Value

Comma-separated file containing aligned XINA clustering results.

## Examples

```
# Generate random multiplexed time-series data
random_data_info <- make_random_xina_data()

# Data files
data_files <- paste(random_data_info$conditions, ".csv", sep='')

# time points of the data matrix
data_column <- random_data_info$time_points

# mclust requires the fixed random seed to get reproduce the clustering results
set.seed(0)

# Run the model-based clustering
example_clusters <- xina_clustering(data_files, data_column=data_column, nClusters=30)

# Reload the clustering result
example_clusters_reloaded <- load_previous_results(".")
```

---

# make_random_xina_data *make_random_xina_data*

---

## Description

Generate random proteomics dataset for testing XINA 'make_random_xina_data' will make random proteomics data for XINA test. The generated data will have three conditions and seven time points, c("0hr", "2hr", "6hr", "12hr", "24hr", "48hr", "72hr").

## Usage

```
make_random_xina_data(n = 500, mtor = TRUE, time_points = c("0hr", "2hr",
  "6hr", "12hr", "24hr", "48hr", "72hr"), conditions = c("Control",
  "Stimulus1", "Stimulus2"))
```

## Arguments

| | |
|---|---|
| n | The number of proteins for one condition. Default is 500. |
| mtor | If it is TRUE (default), mTOR pathway genes will be significant. If it is FALSE, randomly selected genes will be significant in first three conditions. |
| time_points | A vector containing time points of the data matrix |
| conditions | A vector containing condition information, for example normal, disease and drug treated disase. |

## Value

Three comma-separated files containing time-series data for XINA

## Examples

```
make_random_xina_data()
g1 <- read.csv("Control.csv", check.names=FALSE, stringsAsFactors = FALSE)
g2 <- read.csv("Stimulus1.csv", check.names=FALSE, stringsAsFactors = FALSE)
g3 <- read.csv("Stimulus2.csv", check.names=FALSE, stringsAsFactors = FALSE)

# Model-based clustering
example_clusters <- xina_clustering(c("Control.csv","Stimulus1.csv","Stimulus2.csv"),
data_column=c("0hr","6hr","12hr","24hr","48hr","72hr"), nClusters=30)

# Plot clustered plots
plot_clusters(example_clusters)

# Plot pie-charts of condition composition
condition_composition <- plot_condition_compositions(example_clusters)
```

---

`mutate_colors` *mutate_colors*

---

## Description

'mutate_colors' generates new color scheme for XINA clustering plot based on condition composition results (plot_condition_compositions). If any clusters have higher percentage than the 'threshold_percent', XINA will assign new colors in accordance to 'color_for_condition'. If not, XINA will give 'gray' color or user-defined color via 'null_color' parameter.

## Usage

```
mutate_colors(condition_composition, color_for_condition, null_color = "gray",
  threshold_percent = 50)
```

## Arguments

| | |
|---|---|
| `condition_composition` | A data frame generated by plot_condition_compositions |
| `color_for_condition` | A vector like 'color_for_condition' of xina_clustering |
| `null_color` | Default is 'gray'. This color is for clusters that are not biased to any of experimental conditions |
| `threshold_percent` | Default is 50. The percentage threshold for giving new colors |

## Value

A data frame containing statistics of XINA network centrality scores

## Examples

```
# load XINA example data
data(xina_example)

# Plot condition composition pie-chart with default option
condition_composition <- plot_condition_compositions(example_clusters)
example_clusters$color_for_clusters <- mutate_colors(condition_composition,
example_clusters$color_for_condition)
plot_clusters(example_clusters, xval=c(0,2,6,12,24,48,72), xylab=FALSE)
```

---

`organize_clusters` *organize_clusters*

---

## Description

Organize XINA clustering information by gene name

## Usage

```
organize_clusters(clustering_dir = getwd(), super_ds, file_out = TRUE)
```

## Arguments

| | |
|---|---|
| `clustering_dir` | The directory path of XINA clustering results |
| `super_ds` | XINA clusters |
| `file_out` | If it is TRUE, it writes the aligned clustering informaion to "xina_clusters_aligned.csv" file. |

## Value

Comma-separated file containing aligned XINA clustering results.

---

`plot_clusters` *plot_clusters*

---

## Description

Draw all the clustering results. 'plot_clusters' draws two plots, scaled and unscaled line graphs. Scaled graphs have same y limits that are 0 to 1 by default, but can be changed via 'y_lim' parameter.

## Usage

```
plot_clusters(clustering_result, y_lim = NULL, xval = NULL, xylab = TRUE,
  ggplot_theme = NULL)
```

### Arguments

| | |
|---|---|
| clustering_result | A list containing XINA clustering results. See xina_clustering |
| y_lim | Y axis limit. If you set y_lim=c(0,1), 'plot_clusters' will plot line graphs scaled from 0 to 1 in y-axis Default is NULL, which means unscaled line graphs. |
| xval | Change X axis values and labels. Default is data_column of the clustering result list |
| xylab | If it is FALSE, x and y labels will be blank. If it is TRUE (defualt), x and y labels will be shown. |
| ggplot_theme | This is ggplot theme to modify XINA clustering plot. |

### Value

Line graphs of all the clusters

### Examples

```
library(ggplot2)

# load XINA example data
data(xina_example)

# Draw clustering plots
plot_clusters(example_clusters)

# Apply theme to the clustering plot
theme1 <- theme(title=element_text(size=8, face='bold'),
axis.text.x = element_text(size=7),
axis.text.y = element_blank(),
axis.ticks.x = element_blank(),
axis.ticks.y = element_blank(),
axis.title.x = element_blank(),
axis.title.y = element_blank())
plot_clusters(example_clusters, ggplot_theme=theme1)
```

---

## plot_clusters_all *plot_clusters_all*

---

### Description

Draw line graphs of all the proteins in the given dataset

### Usage

```
plot_clusters_all(clustering_result, selected_condition = NULL)
```

### Arguments

| | |
|---|---|
| clustering_result | A list containing XINA clustering results. See xina_clustering |
| selected_condition | A condition name to draw the kinetics plot |

## Value

a list containing clustering results and pdf file containing a BIC plot in current working directory.

## Examples

```
# load XINA example data
data(xina_example)

# Plot kinetics of all the proteins in Control
plot_clusters_all(example_clusters, selected_condition="Control")

# Plot kinetics of all the proteins in Stimulus1
plot_clusters_all(example_clusters, selected_condition="Stimulus1")

# Plot kinetics of all the proteins in Stimulus2
plot_clusters_all(example_clusters, selected_condition="Stimulus2")

# Plot kinetics of all the proteins in three data
plot_clusters_all(example_clusters)
```

---

`plot_condition_compositions` *plot_condition_compositions*

---

## Description

computes condition composition of the XINA clustering results and draws pie-charts.

## Usage

```
plot_condition_compositions(clustering_result, bullseye = FALSE,
  ggplot_theme = NULL)
```

## Arguments

| | |
|---|---|
| `clustering_result` | A list containing XINA clustering results. See xina_clustering |
| `bullseye` | If it is TRUE, draw bullseye plot instead of the pie-chart. Default is FALSE |
| `ggplot_theme` | This is ggplot theme to modify condition composition pie-chart and bulles eye plots. |

## Value

A condition composition plot and a data frame containing condition compositions of the clusters

## Examples

```
# load XINA example data
data(xina_example)

# Plot condition composition pie-chart with default option
plot_condition_compositions(example_clusters)

# Make a new color code for conditions
condition_colors <- c("tomato","steelblue1","gold")
names(condition_colors) <- example_clusters$condition
example_clusters$color_for_condition <- condition_colors

# Draw condition composition pie-chart with the new color code
plot_condition_compositions(example_clusters)

# Draw condition composition bullseye plot
plot_condition_compositions(example_clusters, bullseye = TRUE)
```

---

`plot_enrichment_results` *plot_enrichment_results*

---

## Description

Plot GO and KEGG enrichment results

## Usage

```
plot_enrichment_results(enriched_results,
  term_description = "term_description", sig_score = "pvalue",
  num_terms = 0, get_log = TRUE)
```

## Arguments

| | |
|---|---|
| `enriched_results` | GO or KEGG enrichment results. See xina_enrichment and xina_enrichment |
| `term_description` | Description of terms to be drawn on Y axis. Default is "term_description" of XINA enrichment results. |
| `sig_score` | significant score to plot on X axis. Default is "pvalue". |
| `num_terms` | The number of terms to be plotted. Default is 0, which menas no limit. |
| `get_log` | If this is TRUE, 'plot_enrichment_results' will take -log10 of p-values. |

## Value

ggplot bar graph

## Examples

```
library(STRINGdb)

# load XINA example data
data(xina_example)

# Get STRING database for protein-protein intereaction information
string_db <- STRINGdb$new( version="10", species=9606,
score_threshold=0, input_directory="" )
string_db

# XINA analysis with STRING DB
xina_result <- xina_analysis(example_clusters, string_db)

# Select proteins that showed cluster #1 in the Stimulus2 condition
subgroup <- subset(example_clusters$aligned, Stimulus2==1)
protein_list <- as.vector(subgroup$`Gene name`)

# Enrichment test and get significantly enriched functional terms
# that have adjuseted p-value less than 0.1
kegg_enriched <- xina_enrichment(string_db, protein_list,
enrichment_type = "KEGG", pval_threshold=0.1)
plot_enrichment_results(kegg_enriched$KEGG, num_terms=10)
```

---

# plot_NA *plot_NA*

---

## Description

Draw NULL plot

## Usage

```
plot_NA()
```

## Value

a empty plot

---

# rank_centrality *rank_centrality*

---

## Description

Give ranks based on network centrality scores

## Usage

```
rank_centrality(centrality_score, type, num_breaks = 5)
```

### Arguments

| | |
|---|---|
| centrality_score | Network centrality score matrix |
| type | Network centrality score type, such as 'Eigenvector' |
| num_breaks | The number of ranks |

### Value

A vector containing ranks

---

## xina_analysis *xina_analysis*

---

### Description

xina_analysis is to analyze protein-protein interaction(PPI) networks using STRINGdb and igraph R package. This module computes PPI networks within each XINA clusters.

### Usage

```
xina_analysis(clustering_result, ppi_db, is_stringdb = TRUE,
  flag_simplify = TRUE, node_shape = "sphere", num_clusters_in_row = 5,
  img_size = NULL, img_qual = 300)
```

### Arguments

| | |
|---|---|
| clustering_result | A list containing XINA clustering results. See xina_clustering |
| ppi_db | STRINGdb object |
| is_stringdb | If it is TRUE (default), XINA will process 'ppi_db' as STRINGdb, but it is FALSE, XINA will accepts your 'ppi_db' as it is. You can make your own igraph network using customized PPI information instead of STRINGdb. |
| flag_simplify | If it is TRUE (default), XINA will exclude unconnected proteins |
| node_shape | You can choose node shape. Default is "sphere". See shapes |
| num_clusters_in_row | The number of clusters in a row on the XINA network plot. Default is 5. |
| img_size | Set the image size. For width=1000 and height=1500, it is img_size=c(1000,1500). |
| img_qual | Set the image resolution. Default is 300. |

### Value

A PNG file (XINA_Cluster_Networks.png) displaying PPI network plots of all the clusters and a list containing XINA network analysis results.

| Item | Description |
|---|---|
| All_network | PPI network of all the input proteins |
| Sub_network | A list containing PPI networks of each clusters |
| Data | XINA clustering results. See xina_clustering |
| Nodes | A list of proteins in each cluster |

| | |
|---|---|
| Conditions | A list of experimental condition of proteins in each cluster |
| Titles | A list of plot titles for XINA plotting |
| out_dir | A directory path storing XINA network analysis results |
| is_stringdb | False = different PPI DB and TRUE = STRING DB |

## Examples

```
## Not run:
library(STRINGdb)
library(igraph)

# load XINA example data
data(xina_example)

# Get STRING database for protein-protein intereaction information
string_db <- STRINGdb$new( version="10", species=9606, score_threshold=0,
input_directory="" )
string_db

# Run XINA analysis with STRING DB
xina_result <- xina_analysis(example_clusters, string_db)

# Run XINA with a protein-protein interaction edgelist
data(HPRD)
net_all <- simplify(graph_from_data_frame(d=hprd_ppi, directed=F),
remove.multiple = F, remove.loops = T)
xina_result <- xina_analysis(example_clusters, net_all, is_stringdb=FALSE)

## End(Not run)
```

---

`xina_clustering` *xina_clustering*

---

## Description

Clustering multiplexed time-series omics data to find co-abundance profiles

## Usage

```
xina_clustering(f_names, data_column, out_dir = getwd(), nClusters = 20,
  norm = "sum_normalization", chosen_model = "")
```

## Arguments

| | |
|---|---|
| `f_names` | A vector containing input file (.csv) paths |
| `data_column` | A vector containing column names (1st row of the input file) of data matrix |
| `out_dir` | A directory path for saving clustering results. (default: out_dir=getwd()) |
| `nClusters` | The number of desired maximum clusters |

| | |
|---|---|
| norm | Default is "sum_normalization". Sum-normalization is to divide the data matrix by row sum. If you want to know more about sum-normalization, see https://www.ncbi.nlm.nih.gov/pubmed/19861354. "zscore" is to calculate Z score for each protein. See scale. |
| chosen_model | You can choose a specific model rather than testing all the models that are available in mclust. mclustModelNames If you want k-means clustering instead of the model-based clustering, use "kmeans" here. |

## Value

a plot containing a BIC plot in current working directory and a list containing below information:

| Item | Description |
|---|---|
| clusters | XINA clustering results |
| aligned | XINA clustering results aligned by ID |
| data_column | Data matrix column names |
| out_dir | The directory path containing XINA results |
| nClusters | The number of clusters desired by user |
| max_cluster | The number of clusters optimized by BIC |
| chosen_model | The used covariance model for model-based clustering |
| optimal_BIC | BIC of the optimized covariance model |
| condition | Experimental conditions of the user input data |
| color_for_condition | Colors assigned to each experimental conditions which is used for condition composition plot |
| color_for_clusters | Colors assigned to each clusters which is used for XINA clustering plot |
| norm_method | Used normalization method |

## Examples

```
# Generate random multiplexed time-series data
random_data_info <- make_random_xina_data()

# Data files
data_files <- paste(random_data_info$conditions, ".csv", sep='')

# time points of the data matrix
data_column <- random_data_info$time_points

# mclust requires the fixed random seed to get reproduce the clustering results
set.seed(0)

# Run the model-based clustering to find co-abundance profiles
example_clusters <- xina_clustering(data_files, data_column=data_column, nClusters=30)

# Run k-means clustering to find co-abundance profiles
example_clusters <- xina_clustering(data_files, data_column=data_column, nClusters=30,
chosen_model="kmeans")
```

---

xina_enrichment *xina_enrichment*

---

## Description

xina_enrichment conducts functional enrichment tests using gene ontology or KEGG pathway terms for a given protein list

## Usage

```
xina_enrichment(string_db, protein_list, enrichment_type = "GO",
  pval_threshold = 0.05, methodMT = "fdr")
```

## Arguments

| | |
|---|---|
| string_db | STRINGdb object |
| protein_list | A vector of gene names to draw protein-protein interaction network. |
| enrichment_type | A functional annotation for the enrichment test. 'enrichment_type' should be one of 'GO' and 'KEGG', |
| pval_threshold | P-value threshold to get significantly enriched terms from the given proteins |
| methodMT | Method for p-value adjustment. See get_enrichment. Default is 'fdr'. |

## Value

A list of data frames containing enrichment results

## Examples

```
library(STRINGdb)
library(Biobase)

# load XINA example data
data(xina_example)

# Get STRING database for protein-protein intereaction information
string_db <- STRINGdb$new( version="10", species=9606, score_threshold=0, input_directory="" )
string_db

# XINA analysis with STRING DB
xina_result <- xina_analysis(example_clusters, string_db)

# Select proteins that showed cluster #1 in the Stimulus2 condition
subgroup <- subset(example_clusters$aligned, Stimulus2==1)
protein_list <- as.vector(subgroup$`Gene name`)

# Enrichment test using KEGG pathway terms that have adjuseted p-value less than 0.1
kegg_enriched <- xina_enrichment(string_db, protein_list,
enrichment_type = "KEGG", pval_threshold=0.1)
plot_enrichment_results(kegg_enriched$KEGG, num_terms=10)

# Enrichment test using GO terms that have adjuseted p-value less than 0.1
go_enriched <- xina_enrichment(string_db, protein_list,
enrichment_type = "GO", pval_threshold=0.1)
plot_enrichment_results(go_enriched$Component, num_terms=10)
```

xina_plot_all *xina_plot_all*

## Description

xina_plot_all is to draw protein-protein interaction network plots of all the clusters

## Usage

```
xina_plot_all(xina_result, clustering_result, condition = "all",
  centrality_type = NULL, flag_simplify = TRUE, num_breaks = 5,
  layout_specified = "", vertex_label_flag = FALSE,
  vertex.label.color = "black", vertex.color = "", edge.color = NULL,
  vertex.label.dist = 0.6, vertex.label.cex = 0.8, edge.arrow.size = 0.4,
  vertex.size = 10, vertex.shape = "sphere", legend_location = "bottom",
  num_clusters_in_row = 5, flag_unknown_only = FALSE, img_size = NULL,
  img_qual = 300)
```

## Arguments

`xina_result` A list containing XINA network analysis results. See xina_analysis

`clustering_result`
A list containing XINA clustering results. See xina_clustering

`condition` Default is 'all', which means use all the proteins to draw graphs. If you specify the experimental condition name used for XINA clustering, xina_plot_all will draw graphs using specific condition's proteins.

`centrality_type`
'centrality_type' should be one of c('Degree', 'Eigenvector', 'Hub', 'Authority', 'Closeness', 'Betweenness')

| Centrality score | igraph function |
|---|---|
| Degree | degree |
| Eigenvector | eigen_centrality |
| Hub | hub_score |
| Authority | authority_score |
| Closeness | closeness |
| Betweenness | betweenness |

`flag_simplify` If it is TRUE (default), XINA will exclude unconnected proteins

`num_breaks` 'num_breaks' is the number of ranks based on network centrality. Default is 5.

`layout_specified`
This can change network layout. 'layout_specified' should be one of c('sphere', 'star', 'gem', 'tree', 'circle', 'random', 'nicely'). XINA's layouts are based on igraph's layout. See layout_

| Layout | igraph layout name |
|---|---|
| sphere | layout_on_sphere |
| star | layout_as_star |
| gem | layout_with_gem |

| | |
|---|---|
| tree | layout_as_tree |
| circle | layout_in_circle |
| random | layout_randomly |
| nicely | layout_nicely |

Default is 'layout_nicely' of igraph

`vertex_label_flag`
: If vertex_label_flag is TRUE (default), igraph network graphs will be labeled by gene names If vertex_label_flag is FALSE, igraph network graphs will be drawn without labels

`vertex.label.color`
: Color of labels. Default is black

`vertex.color`
: Color of nodes. Default is pink.

`edge.color`
: Color of edges. Default is pink.

`vertex.label.dist`
: Distance between node and label. Default is 0.6

`vertex.label.cex`
: Size of labels Default is 0.8

`edge.arrow.size`
: Size of edges Default is 0.4

`vertex.size`
: Size of nodes Default is 0.4

`vertex.shape`
: You can choose node shape. Default is 'sphere'. See shapes

`legend_location`
: If centrality_type is chosen, xina_plot_single add the color legend guiding rank of nodes based on the centrality score. Default is 'bottomright', but you can choose one of these 'bottomright', 'bottom', 'bottomleft', 'left', 'topleft', 'top', 'topright', 'right' and 'center'.

`num_clusters_in_row`
: The number of clusters in a row on the XINA network plot. Default is 5.

`flag_unknown_only`
: If this is TRUE, 'xina_plot_all' will plot proteins that do not have any protein-protein interaction in the given database

`img_size`
: Set the image size. For width=1000 and height=1500, it is img_size=c(1000,1500). Default is c(3000,3000)

`img_qual`
: Set the image resolution. Default is 300.

## Value

PNG images of PPI network plots of all the clusters

## Examples

```
library(STRINGdb)

# load XINA example data
data(xina_example)

# Get STRING database for protein-protein intereaction information
string_db <- STRINGdb$new( version='10', species=9606, score_threshold=0, input_directory='' )
```

```
string_db

# XINA analysis with STRING DB
xina_result <- xina_analysis(example_clusters, string_db)

# XINA network plots
xina_plot_all(xina_result, example_clusters)

# XINA network plots for Control condition
xina_plot_all(xina_result, example_clusters, condition='Control')
```

---

`xina_plot_bycluster` *xina_plot_bycluster*

---

## Description

xina_plot_bycluster is to draw protein-protein interaction network plots of each cluster

## Usage

```
xina_plot_bycluster(xina_result, clustering_result, cl = NULL,
  condition = "all", flag_legend = TRUE, centrality_type = NULL,
  flag_simplify = TRUE, layout_specified = "", vertex_label_flag = TRUE,
  vertex.label.dist = 0.6, vertex.label.cex = 0.8, edge.arrow.size = 0.4,
  vertex.size = 10, vertex.shape = "sphere", vertex.color = "",
  edge.color = "darkgray", legend_location = "bottom",
  flag_unknown_only = FALSE)
```

## Arguments

| | |
|---|---|
| `xina_result` | A list containing XINA network analysis results. See xina_analysis |
| `clustering_result` | A list containing XINA clustering results. See xina_clustering |
| `cl` | Cluster number in the XINA clustering results |
| `condition` | Default is 'all', which means use all the proteins to draw graphs. If you specify the experimental condition name used for XINA clustering, |
| `flag_legend` | If it is TRUE, a legend will be printed out together. |
| `centrality_type` | 'centrality_type' should be one of c('Degree', 'Eigenvector', 'Hub', 'Authority', 'Closeness', 'Betweenness') |

| Centrality score | igraph function |
|---|---|
| Degree | degree |
| Eigenvector | eigen_centrality |
| Hub | hub_score |
| Authority | authority_score |
| Closeness | closeness |
| Betweenness | betweenness |

`flag_simplify` If it is TRUE (default), XINA will exclude unconnected proteins

`layout_specified`
This can change network layout. 'layout_specified' should be one of c('sphere', 'star', 'gem', 'tree', 'circle', 'random', 'nicely'). XINA's layouts are based on igraph's layout. See layout_

| Layout | igraph layout name |
|---|---|
| sphere | layout_on_sphere |
| star | layout_as_star |
| gem | layout_with_gem |
| tree | layout_as_tree |
| circle | layout_in_circle |
| random | layout_randomly |
| nicely | layout_nicely |

Default is 'layout_nicely' of igraph

`vertex_label_flag`
If vertex_label_flag is TRUE (default), igraph network graphs will be labeled by gene names If vertex_label_flag is FALSE, igraph network graphs will be drawn without labels

`vertex.label.dist`
Distance between node and label. Default is 0.6

`vertex.label.cex`
Size of labels Default is 0.8

`edge.arrow.size`
Size of edges Default is 0.4

`vertex.size` Size of nodes Default is 0.4

`vertex.shape` You can choose node shape. Default is 'sphere'. See shapes

`vertex.color` Color of nodes. Default is pink.

`edge.color` Color of edges. Default is pink.

`legend_location`
If centrality_type is chosen, xina_plot_single add the color legend guiding rank of nodes based on the centrality score. Default is 'bottomright', but you can choose one of these 'bottomright', 'bottom', 'bottomleft', 'left', 'topleft', 'top', 'topright', 'right' and 'center'.

`flag_unknown_only`
If this is TRUE, 'xina_plot_bycluster' will plot proteins that do not have any protein-protein interaction in the given database

## Value

A PNG file (XINA_Cluster_Networks.png) displaying protein-protein interaction network plots of all the clusters and a list containing XINA network analysis results

PNG images of PPI network plots of all the clusters

## Examples

```
library(STRINGdb)
```

```
# load XINA example data
data(xina_example)

# Get STRING database for protein-protein intereaction information
string_db <- STRINGdb$new( version='10', species=9606, score_threshold=0, input_directory='' )
string_db

# XINA analysis with STRING DB
xina_result <- xina_analysis(example_clusters, string_db)

# plot cluster #1
xina_plot_bycluster(xina_result, example_clusters, cl=1)

# plot PPI network of Control condition in cluster #1
xina_plot_bycluster(xina_result, example_clusters, cl=1, condition='Control')
```

---

`xina_plot_single` *xina_plot_single*

---

## Description

xina_plot_single draws protein-protein interaction network plot for given 'protein_list'.

## Usage

```
xina_plot_single(xina_result, protein_list, centrality_type = NULL,
  layout_specified = "", vertex_label_flag = TRUE, main = NULL,
  vertex.label.color = "black", vertex.color = NA,
  edge.color = "darkgray", vertex.label.dist = 0.6,
  vertex.label.cex = 0.8, edge.arrow.size = 0.4, vertex.size = 10,
  vertex.shape = "sphere", legend_location = "bottom", num_breaks = 5,
  digits_round_up = 5, flag_simplify = TRUE, flag_legend = TRUE)
```

## Arguments

| | |
|---|---|
| `xina_result` | A list containing XINA network analysis results. See xina_analysis |
| `protein_list` | A vector of gene names to draw a protein-protein interaction network graph. |
| `centrality_type` | 'centrality_type' should be one of c('Degree', 'Eigenvector', 'Hub', 'Authority', 'Closeness', 'Betweenness') |

| Centrality score | igraph function |
|---|---|
| Degree | degree |
| Eigenvector | eigen_centrality |
| Hub | hub_score |
| Authority | authority_score |
| Closeness | closeness |
| Betweenness | betweenness |

`layout_specified`
: This can change network layout. 'layout_specified' should be one of c('sphere', 'star', 'gem', 'tree', 'circle', 'random', 'nicely'). XINA's layouts are based on igraph's layout. See layout_

| Layout | igraph layout name |
|---|---|
| sphere | layout_on_sphere |
| star | layout_as_star |
| gem | layout_with_gem |
| tree | layout_as_tree |
| circle | layout_in_circle |
| random | layout_randomly |
| nicely | layout_nicely |

Default is 'layout_nicely' of igraph

`vertex_label_flag`
: If vertex_label_flag is TRUE (default), igraph network graphs will be labeled by gene names If vertex_label_flag is FALSE, igraph network graphs will be drawn without labels

`main`
: Title of network figure. IF it is NULL (default), it will be the number of plotted proteins

`vertex.label.color`
: Color of labels. Default is black

`vertex.color`
: Color of nodes. Default is pink.

`edge.color`
: Color of edges. Default is pink.

`vertex.label.dist`
: Distance between node and label. Default is 0.6

`vertex.label.cex`
: Size of labels Default is 0.8

`edge.arrow.size`
: Size of edges Default is 0.4

`vertex.size`
: Size of nodes Default is 0.4

`vertex.shape`
: You can choose node shape. Default is 'sphere'. See shapes

`legend_location`
: If centrality_type is chosen, 'xina_plot_single' adds the color legend guiding rank of nodes based on the centrality score. Default is 'bottomright', but you can choose one of these 'bottomright', 'bottom', 'bottomleft', 'left', 'topleft', 'top', 'topright', 'right' and 'center'.

`num_breaks`
: 'num_breaks' is the number of ranks based on network centrality. Default is 5.

`digits_round_up`
: See Round

`flag_simplify`
: If it is TRUE (default), XINA will exclude unconnected proteins

`flag_legend`
: If it is TRUE, a legend will be printed out together.

## Value

A PNG file (XINA_Cluster_Networks.png) displaying protein-protein interaction network plots of all the clusters and a list containing XINA network analysis results

## Examples

```
library(STRINGdb)
library(Biobase)

# load XINA example data
data(xina_example)

# Get STRING database for protein-protein intereaction information
string_db <- STRINGdb$new( version='10', species=9606, score_threshold=0, input_directory='' )
string_db

# XINA analysis with STRING DB
xina_result <- xina_analysis(example_clusters, string_db)

subgroup <- subset(example_clusters$aligned, Stimulus2==21)
protein_list <- subgroup$`Gene name`

# Calculate protein-protein interaction network
xina_plot_single(xina_result, protein_list)

# Calculate protein-protein interaction network and Eigenvector centrality
eigen_info <- xina_plot_single(xina_result, protein_list, centrality_type='Eigenvector')
```

# Index
